1. CODE TEMPLATES

1.1. **Basic Configuration.** Vim and (Caps Lock = Escape) configuration.

```
1 xset r rate 150 100
2 xmodmap -e "remove Lock = Caps_Lock" -e "keysym Caps_Lock = Escape" -e "add Lock = Caps_Lock"
3 echo "set nocompatible sw=4 ts=4 sts=4 si cindent ru noeb showcmd showmode | syn on | colorscheme slate" >
   ~/.vimrc
```

```
1 #include <algorithm>
2 #include <cassert>
3 #include <cmath>
4 #include <cstdio>
5 #include <cstdlib>
6 #include <cstring>
7 #include <ctime>
8 #include <iomanip>
9 #include <iostream>
10 #include <map>
11 #include <queue>
12 #include <set>
13 #include <sstream>
14 #include <stack>
15 #include <string>
16 #include <utility>
17 #include <vector>
18 using namespace std;
19
20 #define all(o) (o).begin(), (o).end()
21 #define allr(o) (o).rbegin(), (o).rend()
22 #define pb push_back
23 const int INF = 2147483647;
24 const double EPS = 1e-9;
25 const double pi = acos(-1);
26 typedef long long ll;
27 typedef unsigned long long ull;
28 typedef pair<int, int> ii;
29 typedef vector<int> vi;
30 typedef vector<ii> vii;
31 typedef vector<vi> vvi;
32 typedef vector<vii> vvii;

146 void right_rotate(node *n) { rotate(l, r); }
147
148 void fix(node *n) {
```

```
149     while (n) {
150         augment(n);
151         if (too_heavy(n)) {
152             if (left_heavy(n) && right_heavy(n->l)) left_rotate(n->l);
153             else if (right_heavy(n) && left_heavy(n->r)) right_rotate(n->r);
154             if (left_heavy(n)) right_rotate(n);
155             else left_rotate(n);
156             n = n->p;
157         }
158
159         n = n->p;
160     }
161 }
162 };
```

Also a very simple wrapper over the AVL tree that implements a map interface.

```
1  #include "avl_tree.cpp"
2
3  template <class K, class V>
4  class avl_map {
5  public:
6      struct node {
7          K key;
8          V value;
9          node(K k, V v) : key(k), value(v) { }
10
11          bool operator <(const node &other) const {
12              return key < other.key;
13          }
14      };
15
16      avl_tree<node> tree;
17
18      V& operator [] (K key) {
19          typename avl_tree<node>::node *n = tree.find(node(key, V(0)));
20          if (!n) n = tree.insert(node(key, V(0)));
21          return n->item.value;
22      }
23 };
```

2.7. **Skiplist.** An implementation of a skiplist.

```
1  #define BP 0.20
2  #define MAX_LEVEL 10
3  unsigned int bernoulli(unsigned int MAX) {
4      unsigned int cnt = 0;
5      while(((float) rand() / RAND_MAX) < BP && cnt < MAX) cnt++;
6      return cnt;
7  }
8  template<class T>
9  class skiplist {
10 public:
11     struct node {
12         T item;
13         int lens[MAX_LEVEL + 1];
14         node **next;
15         node(int level, T i) : item(i), next((node**)calloc(level + 1, sizeof(node*))) { memset(lens, 0,
16             sizeof(lens)); };
17         ~node() { free(next); next = NULL; };
18     };
19     int current_level, _size;
20     node *head;
21     skiplist() : current_level(0), _size(0), head(new node(MAX_LEVEL, 0)) { };
22     ~skiplist() { clear(); delete head; head = NULL; }
```

```
22     #define FIND_UPDATE(cmp, target) \
23         int pos[MAX_LEVEL + 2]; \
24         memset(pos, 0, sizeof(pos)); \
25         node *x = head; \
26         node *update[MAX_LEVEL + 1]; \
27         memset(update, 0, MAX_LEVEL + 1); \
28         for(int i = MAX_LEVEL; i >= 0; i--) { \
29             pos[i] = pos[i + 1]; \
30             while(x->next[i] != NULL && cmp < target) { pos[i] += x->lens[i]; x = x->next[i]; } \
31             update[i] = x; \
32         } x = x->next[0];
33 int size() { return _size; }
34 void clear() { while(head->next && head->next[0]) erase(head->next[0]->item); }
35 node *find(T target) {
36     FIND_UPDATE(x->next[i]->item, target);
37     return x && x->item == target ? x : NULL;
38 }
39 node *find_kth(int k) { FIND_UPDATE(pos[i] + x->lens[i], k); return x; }
40 int count_greater(T target) { FIND_UPDATE(x->next[i]->item, target); return _size - pos[0] - 1; }
41 node* insert(T target) {
42     FIND_UPDATE(x->next[i]->item, target);
43     // SET
44     if(x && x->item == target) return x;
45     int lvl = bernoulli(MAX_LEVEL);
46     if(lvl > current_level) current_level = lvl;
47     x = new node(lvl, target);
48     for(int i = 0; i <= lvl; i++) {

64                 update[i]->lens[i] = update[i]->lens[i] + x->lens[i] - 1;
65             } else update[i]->lens[i] = update[i]->lens[i] - 1;
66         }
67         delete x; _size--;
68         while(current_level > 0 && head->next[current_level] == NULL) current_level--;
69     }
70 }
71 };
```

2.8. **Heap.** An implementation of a binary heap.

```
1  #define RESIZE
2  #define SWP(x,y) tmp = x, x = y, y = tmp
3
4  struct default_int_cmp {
5      default_int_cmp() { }
6      bool operator()(const int &a, const int &b) {
7          return a < b;
8      }
9  };
10
```

```
11 template <class Compare = default_int_cmp>
12 class heap {
13 private:
14     int len, count, *q, *loc, tmp;
15     Compare _cmp;
16
17     inline bool cmp(int i, int j) { return _cmp(q[i], q[j]); }
18     inline void swp(int i, int j) { SWP(q[i], q[j]), SWP(loc[q[i]], loc[q[j]]); }
19
20     void swim(int i) {
21         while (i > 0) {
22             int p = (i - 1) / 2;
23             if (!cmp(i, p)) break;
24             swp(i, p), i = p;
25         }
26     }
27
28     void sink(int i) {
29         while (true) {

83 }
84
85 int top() { assert(count > 0); return q[0]; }
86 void heapify() { for (int i = count - 1; i > 0; i--) if (cmp(i, (i - 1) / 2)) swp(i, (i - 1) / 2); }
87 void update_key(int n) { assert(loc[n] != -1, swim(loc[n]), sink(loc[n])); }
88 bool empty() { return count == 0; }
89 int size() { return count; }
90 void clear() { count = 0, memset(loc, 255, len << 2); }
91 };
```

3. GRAPHS

3.1. Breadth-First Search. An implementation of a breadth-first search that counts the number of edges on the shortest path from the starting vertex to the ending vertex in the specified unweighted graph (which is represented with an adjacency list). Note that it assumes that the two vertices are connected. It runs in $O(|V| + |E|)$ time.

```
1  int bfs(int start, int end, vvi& adj_list) {
2      queue<ii> Q;
3      Q.push(ii(start, 0));
4
5      while (true) {
6          ii cur = Q.front(); Q.pop();
7
8          if (cur.first == end)
9              return cur.second;
10
11         vi& adj = adj_list[cur.first];
12         for (vi::iterator it = adj.begin(); it != adj.end(); it++)
13             Q.push(ii(*it, cur.second + 1));
14     }
15 }
```

Another implementation that doesn't assume the two vertices are connected. If there is no path from the starting vertex to the ending vertex, a -1 is returned.

```
1  int bfs(int start, int end, vvi& adj_list) {
2      set<int> visited;
3      queue<ii> Q;
4      Q.push(ii(start, 0));
5      visited.insert(start);
6
7      while (!Q.empty()) {
8          ii cur = Q.front(); Q.pop();
9
10         if (cur.first == end)
11             return cur.second;
12
13         vi& adj = adj_list[cur.first];
14         for (vi::iterator it = adj.begin(); it != adj.end(); it++)
15             if (visited.find(*it) == visited.end()) {
16                 Q.push(ii(*it, cur.second + 1));
17                 visited.insert(*it);
18             }
19     }
20
21     return -1;
```

22 }

3.2. Single-Source Shortest Paths.

3.2.1. *Dijkstra's algorithm.* An implementation of Dijkstra's algorithm. It runs in $\Theta(|E| \log |V|)$ time.

```
1  int *dist, *dad;
2  struct cmp {
3      bool operator()(int a, int b) { return dist[a] != dist[b] ? dist[a] < dist[b] : a < b; }
4  };
5
6  pair<int*, int*> dijkstra(int n, int s, vii *adj) {
7      dist = new int[n];
8      dad = new int[n];
9      for (int i = 0; i < n; i++) dist[i] = INF, dad[i] = -1;
10     set<int, cmp> pq;
11     dist[s] = 0, pq.insert(s);
12     while (!pq.empty()) {
13         int cur = *pq.begin(); pq.erase(pq.begin());
14         for (int i = 0, cnt = size(adj[cur]); i < cnt; i++) {
15             int nxt = adj[cur][i].first, ndist = dist[cur] + adj[cur][i].second;
16             if (ndist < dist[nxt]) pq.erase(nxt), dist[nxt] = ndist, dad[nxt] = cur, pq.insert(nxt);
17         }
18     }
19
20     return pair<int*, int*>(dist, dad);
21 }
```

3.2.2. *Bellman-Ford algorithm.* The Bellman-Ford algorithm solves the single-source shortest paths problem in $O(|V||E|)$ time. It is slower than Dijkstra's algorithm, but it works on graphs with negative edges and has the ability to detect negative cycles, neither of which Dijkstra's algorithm can do.

```
1  int* bellman_ford(int n, int s, vii* adj, bool& has_negative_cycle) {
2      has_negative_cycle = false;
3      int* dist = new int[n];
4      for (int i = 0; i < n; i++) dist[i] = i == s ? 0 : INF;
5      for (int i = 0; i < n - 1; i++)
6          for (int j = 0; j < n; j++)
7              if (dist[j] != INF)
8                  for (int k = 0, len = size(adj[j]); k < len; k++)
9                      dist[adj[j][k].first] = min(dist[adj[j][k].first], dist[j] + adj[j][k].second);
10     for (int j = 0; j < n; j++)
11         for (int k = 0, len = size(adj[j]); k < len; k++)
12             if (dist[j] + adj[j][k].second < dist[adj[j][k].first])
13                 has_negative_cycle = true;
14     return dist;
15 }
```

3.3. All-Pairs Shortest Paths.

3.3.1. *Floyd-Warshall algorithm.* The Floyd-Warshall algorithm solves the all-pairs shortest paths problem in $O(|V|^3)$ time.

```
1  void floyd_warshall(int** arr, int n) {
2      for (int k = 0; k < n; k++)
3          for (int i = 0; i < n; i++)
4              for (int j = 0; j < n; j++)
5                  if (arr[i][k] != INF && arr[k][j] != INF)
6                      arr[i][j] = min(arr[i][j], arr[i][k] + arr[k][j]);
7  }
```

3.4. Connected Components.

3.5. Strongly Connected Components.

3.5.1. *Kosaraju's algorithm.* Kosaraju's algorithm finds strongly connected components of a directed graph in $O(|V| + |E|)$ time.

```

1  #include "../data-structures/union_find.cpp"
2
3  vector<bool> visited;
4  vi order;
5
6  void scc_dfs(const vvi &adj, int u) {
7      int v; visited[u] = true;
8      for (int i = 0; i < size(adj[u]); i++) if (!visited[v = adj[u][i]]) scc_dfs(adj, v);
9      order.push_back(u);
10 }
11
12 pair<union_find, vi> scc(const vvi &adj) {
13     int n = size(adj), u, v;
14     order.clear();
15     union_find uf(n);
16     vi dag;
17     vvi rev(n);
18     for (int i = 0; i < n; i++) for (int j = 0; j < size(adj[i]); j++) rev[adj[i][j]].push_back(i);
19     visited.resize(n), fill(all(visited), false);
20     for (int i = 0; i < n; i++) if (!visited[i]) scc_dfs(rev, i);
21     fill(all(visited), false);
22     stack<int> S;
23     for (int i = n-1; i >= 0; i--) {
24         if (visited[order[i]]) continue;
25         S.push(order[i]), dag.push_back(order[i]);
26         while (!S.empty()) {
27             visited[u = S.top()] = true, S.pop(), uf.unite(u, order[i]);
28             for (int i = 0; i < size(adj[u]); i++) if (!visited[v = adj[u][i]]) S.push(v);
29         }
30     }
31     return pair<union_find, vi>(uf, dag);
32 }

```

3.6. Minimum Spanning Tree.

```

1  #include "../data-structures/union_find.cpp"
2
3  // n is the number of vertices
4  // edges is a list of edges of the form (weight, (a, b))
5  // the edges in the minimum spanning tree are returned on the same form
6  vector<pair<int, ii>> mst(int n, vector<pair<int, ii>> edges) {
7      union_find uf(n);
8      sort(all(edges));
9      vector<pair<int, ii>> res;
10     for (int i = 0, cnt = size(edges); i < cnt; i++)
11         if (uf.find(edges[i].second.first) != uf.find(edges[i].second.second)) {
12             res.push_back(edges[i]);
13             uf.unite(edges[i].second.first, edges[i].second.second);
14         }
15     return res;
16 }

```

3.7. Topological Sort.

```

1  void tsort_dfs(int cur, char* color, const vvi& adj, stack<int>& res, bool& has_cycle) {
2      color[cur] = 1;
3      for (int i = 0, cnt = size(adj[cur]); i < cnt; i++) {
4          int nxt = adj[cur][i];
5          if (color[nxt] == 0)
6              tsort_dfs(nxt, color, adj, res, has_cycle);
7          else if (color[nxt] == 1)
8              has_cycle = true;

```

```
9     if (has_cycle) return;
10 }
11 color[cur] = 2;
12 res.push(cur);
13 }
14
15 vi tsort(int n, vvi adj, bool& has_cycle) {
16     has_cycle = false;
17     stack<int> S;
18     vi res;
19     char* color = new char[n];
20     memset(color, 0, n);
21     for (int i = 0; i < n; i++) {
22         if (!color[i]) {
23             tsort_dfs(i, color, adj, S, has_cycle);
24             if (has_cycle) return res;
25         }
26     }
27     while (!S.empty()) res.push_back(S.top()), S.pop();
28     return res;
29 }
```

3.8. Bipartite Matching. The alternating paths algorithm solves bipartite matching in $O(mn^2)$ time, where m, n are the number of vertices on the left and right side of the bipartite graph, respectively.

```
1 vi* adj;
2 bool* done;
3 int* owner;
4
5 int alternating_path(int left) {
6     if (done[left]) return 0;
7     done[left] = true;
8     for (int i = 0; i < size(adj[left]); i++) {
9         int right = adj[left][i];
10        if (owner[right] == -1 || alternating_path(owner[right])) {
11            owner[right] = left;
12            return 1;
13        }
14    }
15
16    return 0;
17 }
```

3.9. Maximum Flow.

3.9.1. Edmonds Karp's algorithm. An implementation of Edmonds Karp's algorithm that runs in $O(|V||E|^2)$. It computes the maximum flow of a flow network.

```
1 struct mf_edge {
2     int u, v, w;
3     mf_edge* rev;

3.10. Minimum Cost Maximum Flow. An implementation of Edmonds Karp's algorithm, modified to find shortest path to augment each time (instead of just any path). It computes the maximum flow of a flow network, and when there are multiple maximum flows, finds the maximum flow with minimum cost.

```
1 struct mcmf_edge {
2     int u, v, w, c;
3     mcmf_edge* rev;
4     mcmf_edge(int _u, int _v, int _w, int _c, mcmf_edge* _rev = NULL) {
```

```
5     u = _u; v = _v; w = _w; c = _c; rev = _rev;
6 }
7 };
8
9 ii min_cost_max_flow(int n, int s, int t, vector<pair<int, ii> >* adj) {
10     vector<mcmf_edge*>* g = new vector<mcmf_edge*>[n];
11     for (int i = 0; i < n; i++) {
12         for (int j = 0, len = size(adj[i]); j < len; j++) {
13             mcmf_edge *cur = new mcmf_edge(i, adj[i][j].first, adj[i][j].second.first,
14                 adj[i][j].second.second),
15                 *rev = new mcmf_edge(adj[i][j].first, i, 0, -adj[i][j].second.second, cur);
16             cur->rev = rev;

63 }
```

4. STRINGS

4.1. **The Z algorithm.** Given a string S , $Z_i(S)$ is the longest substring of S starting at i that is also a prefix of S . The Z algorithm computes these Z values in $O(n)$ time, where $n = |S|$. Z values can, for example, be used to find all occurrences of a pattern P in a string T in linear time. This is accomplished by computing Z values of $S = TP$, and looking for all i such that $Z_i \geq |T|$.

```
1  int* z_values(string s) {
2      int n = size(s);
3      int* z = new int[n];
4      int l = 0, r = 0;
5      z[0] = n;
6      for (int i = 1; i < n; i++) {
7          z[i] = 0;
8          if (i > r) {
9              l = r = i;
10             while (r < n && s[r - l] == s[r]) r++;
11             z[i] = r - l; r--;
12         } else {
13             if (z[i - l] < r - i + 1) z[i] = z[i - l];
14             else {
15                 l = i;
16                 while (r < n && s[r - l] == s[r]) r++;
17                 z[i] = r - l; r--;
18             }
19         }
20     }
21
22     return z;
23 }
```

5. MATHEMATICS

5.1. **Fraction.** A fraction (rational number) class. Note that numbers are stored in lowest common terms.

```
1  template <class T>
2  class fraction {
3  private:
4      T gcd(T a, T b) {
5          return b == T(0) ? a : gcd(b, a % b);
6      }
7
8  public:
9      T n, d;
10
11     fraction(T n_, T d_) {
12         assert(d_ != 0);
13         n = n_;
14         d = d_;
15
16         if (d < T(0)) {
17             n = -n;
18             d = -d;
19         }
20
21         T g = gcd(abs(n), abs(d));
22         n /= g;
23         d /= g;
24     }
25
26     fraction(T n_) {
27         n = n_;
28         d = 1;
29     }
30
31     fraction(const fraction<T>& other) {
```

```
32     n = other.n;
33     d = other.d;
34 }
35
36 fraction<T> operator +(const fraction<T>& other) const {
37     return fraction<T>(n * other.d + other.n * d, d * other.d);
38 }
39
40 fraction<T> operator -(const fraction<T>& other) const {
41     return fraction<T>(n * other.d - other.n * d, d * other.d);
42 }
43
44 fraction<T> operator *(const fraction<T>& other) const {
45     return fraction<T>(n * other.n, d * other.d);
46 }
47
48 fraction<T> operator /(const fraction<T>& other) const {
49     return fraction<T>(n * other.d, d * other.n);
50 }
51
52 bool operator <(const fraction<T>& other) const {
53     return n * other.d < other.n * d;
54 }
55
56 bool operator <=(const fraction<T>& other) const {
57     return !(other < *this);
58 }
59
60 bool operator >(const fraction<T>& other) const {
61     return other < *this;
62 }
63
64 bool operator >=(const fraction<T>& other) const {
65     return !(*this < other);
66 }
67
68 bool operator ==(const fraction<T>& other) const {
69     return n == other.n && d == other.d;
70 }
71
72 bool operator !=(const fraction<T>& other) const {
73     return !(*this == other);
74 }
75 };
```

5.2. **Binomial Coefficients.** The binomial coefficient $\binom{n}{k} = \frac{n!}{k!(n-k)!}$ is the number of ways to choose k items out of a total of n items.

```
1 int nck(int n, int k) {
2     if (n - k < k)
3         k = n - k;
4
5     int res = 1;
6     for (int i = 1; i <= k; i++)
7         res = res * (n - (k - i)) / i;
8
9     return res;
10 }
11
12 void nck_precompute(int** arr, int n) {
13     for (int i = 0; i < n; i++)
14         arr[i][0] = arr[i][i] = 1;
15
16     for (int i = 1; i < n; i++)
```

```
6     for (int j = 1; j < i; j++)
7         arr[i][j] = arr[i - 1][j - 1] + arr[i - 1][j];
8 }
```

5.3. **Euclidean algorithm.** The Euclidean algorithm computes the greatest common divisor of two integers a, b .

```
1 int _gcd_(int a, int b) {
2     return b == 0 ? a : _gcd_(b, a % b);
3 }
4
5 int gcd(int a, int b) {
6     return (a < 0 && b < 0 ? -1 : 1) * _gcd_(abs(a), abs(b));
7 }
```

The extended Euclidean algorithm computes the greatest common divisor d of two integers a, b and also finds two integers x, y such that $a \times x + b \times y = d$.

```
1 int _egcd_(int a, int b, int& x, int& y) {
2     if (b == 0) {
3         x = 1; y = 0;
4         return a;
5     } else {
6         int d = _egcd_(b, a % b, x, y);
7         x -= a / b * y;
8         swap(x, y);
9         return d;
10    }
11 }
12
13 int egcd(int a, int b, int& x, int& y) {
14     int d = _egcd_(abs(a), abs(b), x, y);
15     if (a < 0) x = -x;
16     if (b < 0) y = -y;
17     return a < 0 && b < 0 ? -d : d;
18 }
```

5.4. **Trial Division Primality Testing.** An optimized trial division to check whether an integer is prime.

```
1 bool is_prime(int n) {
2     if (n < 2) return false;
3     if (n < 4) return true;
4     if (n % 2 == 0 || n % 3 == 0) return false;
5     if (n < 25) return true;
6
7     int s = static_cast<int>(sqrt(static_cast<double>(n)));
8     for (int i = 5; i <= s; i += 6) {
9         if (n % i == 0) return false;
10        if (n % (i + 2) == 0) return false;
11    }
12
13    return true;
14 }
```

5.5. **Sieve of Eratosthenes.** An optimized implementation of Eratosthenes' Sieve.

```
1 vector<int> prime_sieve(int n) {
2     int mx = (n - 3) >> 1;
3     vector<int> primes;
4     bool* prime = new bool[mx + 1];
5     memset(prime, 1, mx + 1);
6
7     if (n >= 2)
8         primes.push_back(2);
9
10    int i = 0;
11    for ( ; i <= mx; i++)
12        if (prime[i]) {
```

```
13         int v = (i << 1) + 3;
14         primes.push_back(v);
15         int sq = i * ((i << 1) + 6) + 3;
16         if (sq > mx) break;
17         for (int j = sq; j <= mx; j += v)
18             prime[j] = false;
19     }
20
21     for (i++; i <= mx; i++)
22         if (prime[i])
23             primes.push_back((i << 1) + 3);
24
25     delete[] prime; // can be used for O(1) lookup
26     return primes;
27 }
```

5.6. **Numeric Integration.** Numeric integration using Simpson's method.

```
1 double integrate(double (*f)(double), double a, double b, double delta = 1e-6) {
2     if (abs(a - b) < delta) return (b-a)/8 * (f(a) + 3*f((2*a+b)/3) + 3*f((a+2*b)/3) + f(b));
3     return integrate(f, a, (a+b)/2, delta) + integrate(f, (a+b)/2, b, delta);
4 }
```

```
1 #include "egcd.cpp"
2
3 int mod_inv(int a, int m) {
4     assert(m > 1);
5     int x, y, d = egcd(a, m, x, y);
6     if (d != 1) return -1;
7     return x < 0 ? x + m : x;
8 }
```

```
1 template <class T>
2 T mod_pow(T b, T e, T m) {
3     assert(e >= T(0));
4     assert(m > T(0));
5     T res = T(1);
6     while (e) {
7         if (e & T(1)) res = mod(res * b, m);
8         b = mod(b * b, m);
9         e >>= T(1);
10    }
11
12    return res;
13 }
```

```
1 #include "gcd.cpp"
2 #include "egcd.cpp"
3
4 int crt(const vi& as, const vi& ns) {
5     assert(size(as) == size(ns));
6     int cnt = size(as), N = 1, x = 0, r, s, l;
7     for (int i = 0; i < cnt; i++) {
8         N *= ns[i];
9         assert(ns[i] > 0);
10        for (int j = 0; j < cnt; j++)
11            if (i != j)
12                assert(gcd(ns[i], ns[j]) == 1);
13    }
14
15    for (int i = 0; i < cnt; i++) {
16        egcd(ns[i], l = N/ns[i], r, s);
```

```

17     x += as[i] * s * l;
18 }
19
20 return mod(x, N);
21 }

```

5.10. Formulas.

5.10.1. Combinatorics.

- Number of ways to choose k objects from a total of n objects where order matters and each item can only be chosen once: $P_k^n = \frac{n!}{(n-k)!}$
- Number of ways to choose k objects from a total of n objects where order matters and each item can be chosen multiple times: n^k
- Number of permutations of n objects, where there are n_1 objects of type 1, n_2 objects of type 2, \dots , n_k objects of type k : $\frac{n!}{n_1! \times n_2! \times \dots \times n_k!}$
- Number of ways to choose k objects from a total of n objects where order does not matter and each item can only be chosen once:

$$\binom{n}{k} = \binom{n-1}{k-1} + \binom{n-1}{k} = \binom{n}{n-k} = \prod_{i=1}^k \frac{n-(k-i)}{i} = \frac{n!}{k!(n-k)!}, \binom{n}{0} = 1, \binom{0}{k} = 0$$
- Number of ways to choose k objects from a total of n objects where order does not matter and each item can be chosen multiple times: $f_k^n = \binom{n+k-1}{k} = \frac{(n+k-1)!}{k!(n-1)!}$
- Number of integer solutions to $x_1 + x_2 + \dots + x_n = k$ where $x_i \geq 0$: f_k^n
- Number of subsets of a set with n elements: 2^n
- $|A \cup B| = |A| + |B| - |A \cap B|$
- $|A \cup B \cup C| = |A| + |B| + |C| - |A \cap B| - |A \cap C| - |B \cap C| + |A \cap B \cap C|$
- Number of ways to walk from the lower-left corner to the upper-right corner of an $n \times m$ grid by walking only up and to the right: $\binom{n+m}{m}$
- Number of strings with n sets of brackets such that the brackets are balanced:

$$C_n = \sum_{k=0}^{n-1} C_k C_{n-1-k} = \frac{1}{n+1} \binom{2n}{n}$$
- Number of triangulations of a convex polygon with n points, number of rooted binary trees with $n+1$ vertices, number of paths across an $n \times n$ lattice which do not rise above the main diagonal: C_n
- Number of permutations of n objects with exactly k ascending sequences or *runs*:

$$\langle n \rangle_k = \langle n-k-1 \rangle_k = k \langle n-1 \rangle_k + (n-k+1) \langle n-1 \rangle_{k-1} = \sum_{i=0}^k (-1)^i \binom{n+1}{i} (k+1-i)^n, \langle n \rangle_0 = \langle n \rangle_{n-1} = 1$$
- Number of permutations of n objects with exactly k cycles: $[n]_k = \begin{bmatrix} n-1 \\ k-1 \end{bmatrix} + (n-1) \begin{bmatrix} n-1 \\ k \end{bmatrix}$
- Number of ways to partition n objects into k sets: $\left\{ \begin{matrix} n \\ k \end{matrix} \right\} = k \left\{ \begin{matrix} n-1 \\ k \end{matrix} \right\} + \left\{ \begin{matrix} n-1 \\ k-1 \end{matrix} \right\}, \left\{ \begin{matrix} n \\ 0 \end{matrix} \right\} = \left\{ \begin{matrix} n \\ n \end{matrix} \right\} = 1$

```

6.0.4. *Formulas.* Let $a = (a_x, a_y)$ and $b = (b_x, b_y)$ be two-dimensional vectors.

- $a \cdot b = |a||b| \cos \theta$, where θ is the angle between a and b .
- $a \times b = |a||b| \sin \theta$, where θ is the signed angle between a and b .
- $a \times b$ is equal to the area of the parallelogram with two of its sides formed by a and b . Half of that is the area of the triangle formed by a and b .

7. OTHER ALGORITHMS

7.1. **Binary Search.** An implementation of binary search that finds a real valued root of the continuous function f on the interval $[a, b]$, with a maximum error of ε .

```
1 double binary_search_continuous(double low, double high, double eps, double (*f)(double)) {
2     while (true) {
3         double mid = (low + high) / 2, cur = f(mid);
4         if (abs(cur) < eps) return mid;
5         else if (0 < cur) high = mid;
6         else low = mid;
7     }
8 }
```

Another implementation that takes a binary predicate f , and finds an integer value x on the integer interval $[a, b]$ such that $f(x) \wedge \neg f(x-1)$.

```
1 int binary_search_discrete(int low, int high, bool (*f)(int)) {
2     assert(low <= high);
3     while (low < high) {
4         int mid = low + (high - low) / 2;
5         if (f(mid)) high = mid;
6         else low = mid + 1;
7     }
8     assert(f(low));
9     return low;
10 }

1 #include "../graph/scc.cpp"
2
3 bool two_sat(int n, const vii& clauses, vi& all_truthy) {
4     all_truthy.clear();
5     vvi adj(2*n+1);
6     for (int i = 0, cnt = size(causes); i < cnt; i++) {
7         adj[-clauses[i].first + n].push_back(clauses[i].second + n);
8         if (clauses[i].first != clauses[i].second)
9             adj[-clauses[i].second + n].push_back(clauses[i].first + n);
10    }
11    pair<union_find, vi> res = scc(adj);
12    union_find scc = res.first;
13    vi dag = res.second;
14    vi truth(2*n+1, -1);
15    for (int i = 2*n; i >= 0; i--) {
16        int cur = order[i] - n, p = scc.find(cur + n), o = scc.find(-cur + n);
17        if (cur == 0) continue;
18        if (p == o) return false;
19        if (truth[p] == -1) truth[p] = 1;
20        truth[cur + n] = truth[p];
21        truth[o] = 1 - truth[p];
22        if (truth[p] == 1) all_truthy.push_back(cur);
23    }
24    return true;
25 }
```

7.3. ***nth* Permutation.** A very fast algorithm for computing the n th permutation of the list $\{0, 1, \dots, k-1\}$.

```
1 vector<int> nth_permutation(int cnt, int n) {
2     vector<int> idx(cnt), per(cnt), fac(cnt);
3     for (int i = 0; i < cnt; i++) idx[i] = i;
4     for (int i = 1; i <= cnt; i++) fac[i - 1] = n % i, n /= i;
5     for (int i = cnt - 1; i >= 0; i--) per[cnt - i - 1] = idx[fac[i]], idx.erase(idx.begin() + fac[i]);
6     return per;
7 }
```

7.4. **Cycle-Finding.**

```
1 ii find_cycle(int x0, int (*f)(int)) {
2     int t = f(x0), h = f(t), mu = 0, lam = 1;
3     while (t != h) t = f(t), h = f(f(h));
4     h = x0;
5     while (t != h) t = f(t), h = f(h), mu++;
6     h = f(t);
7     while (t != h) h = f(h), lam++;
8     return ii(mu, lam);
9 }

1 int intToDay(int jd) { return jd % 7; }
2 int dateToInt(int y, int m, int d) {
3     return 1461 * (y + 4800 + (m - 14) / 12) / 4 +
4         367 * (m - 2 - (m - 14) / 12 * 12) / 12 -
5         3 * ((y + 4900 + (m - 14) / 12) / 100) / 4 +
6         d - 32075;
7 }
8 void intToDate(int jd, int &y, int &m, int &d) {
9     int x, n, i, j;
10    x = jd + 68569;
11    n = 4 * x / 146097;
12    x -= (146097 * n + 3) / 4;
13    i = (4000 * (x + 1)) / 1461001;
14    x -= 1461 * i / 4 - 31;
15    j = 80 * x / 2447;
16    d = x - 2447 * j / 80;
17    x = j / 11;
18    m = j + 2 - 12 * x;
19    y = 100 * (n - 49) + i + x;
20 }
```

8. USEFUL INFORMATION

8.1. Tips & Tricks.

- How fast does our algorithm have to be? Can we use brute-force?
- Does order matter?
- Is it better to look at the problem in another way? Maybe backwards?
- Are there subproblems that are recomputed? Can we cache them?
- Do we need to remember everything we compute, or just the last few iterations of computation?
- Does it help to sort the data?
- Can we speed up lookup by using a map (tree or hash) or an array?
- Can we binary search the answer?
- Can we add vertices/edges to the graph to make the problem easier? Can we turn the graph into some other kind of a graph (perhaps a DAG, or a flow network)?
- Make sure integers are not overflowing.
- Is it better to compute the answer modulo n ? Perhaps we can compute the answer modulo m_1, m_2, \dots, m_k , where m_1, m_2, \dots, m_k are pairwise coprime integers, and find the real answer using CRT?

- Are there any edge cases? When $n = 0, n = -1, n = 1, n = 2^{31} - 1$ or $n = -2^{31}$? When the list is empty, or contains a single element? When the graph is empty, or contains a single vertex? When the graph contains self-loops? When the polygon is concave or non-simple?
- Can we use exponentiation by squaring?

8.2. Fast Input Reading. If input or output is huge, sometimes it is beneficial to optimize the input reading/output writing. This can be achieved by reading all input in at once (using `fread`), and then parsing it manually. Output can also be stored in an output buffer and then dumped once in the end (using `fwrite`). A simpler, but still effective, way to achieve speed is to use the following input reading method.

```

1 void readn(register int *n) {
2     int sign = 1;
3     register char c;
4     *n = 0;
5     while((c = getc_unlocked(stdin)) != '\n') {
6         switch(c) {
7             case '-': sign = -1; break;
8             case ' ': goto hell;
9             case '\n': goto hell;
10            default: *n *= 10; *n += c - '0'; break;
11        }
12    }
13 hell:
14     *n *= sign;
15 }

```

	n	Worst AC Algorithm	Comment
8.3. Worst Time Complexity.	≤ 10	$O(n!), O(n^6)$	e.g. Enumerating a permutation
	≤ 15	$O(2^n \times n^2)$	e.g. DP TSP
	≤ 20	$O(2^n), O(n^5)$	e.g. DP + bitmask technique
	≤ 50	$O(n^4)$	e.g. DP with 3 dimensions + $O(n)$ loop, choosing ${}_nC_k = 4$
	$\leq 10^2$	$O(n^3)$	e.g. Floyd Warshall's
	$\leq 10^3$	$O(n^2)$	e.g. Bubble/Selection/Insertion sort
	$\leq 10^5$	$O(n \log_2 n)$	e.g. Merge sort, building a Segment tree
	$\leq 10^6$	$O(n), O(\log_2 n), O(1)$	Usually, contest problems have $n \leq 10^6$ (e.g. to read input)

8.4. Bit Hacks.

- $n \& -n$ returns the first set bit in n .
- $n \& (n - 1)$ is 0 only if n is a power of two.
- `snoob(x)` returns the next integer that has the same amount of bits set as x . Useful for iterating through subsets of some specified size.

```

1 int snoob(int x) {
2     int y = x & -x, z = x + y;
3     return z | ((x ^ z) >> 2) / y;
4 }

```
