Team Reference Document

25/09/2015

Contents

1. Code Templates

1.1. Basic Configuration.

Vim and (Caps Lock = Escape) configuration.

```
o.yqtxmal ekrpat  # setxkbmap dvorak for dvorak on qwerty
setxkbmap -option caps:escape
set -o vi
xset r rate 150 100
cat > ~/.vimrc
set nocp et sw=4 ts=4 sts=4 si cindent hi=1000 nu ru noeb showcmd showmode
syn on | colorscheme slate
```

1.2. C++ Header.

A C++ header.

```
#include <bits/stdc++.h>------------------------------------------------------// 84
using namespace std;----------------------------------------------------------// 16
template <class T> int size(const T &x) { return x.size(); }------------------// 5f
#define rep(i,a,b) for (__typeof(a) i=(a); i<(b); ++i)------------------------// 6c
#define iter(it,c) for (__typeof((c).begin()) it = (c).begin(); it != (c).end(); ++it)
typedef pair<int, int> ii;----------------------------------------------------// 44
typedef vector<int> vi;-------------------------------------------------------// 9d
typedef vector<ii> vii;-------------------------------------------------------// eb
typedef long long ll;---------------------------------------------------------// 47
const int INF = 2147483647;---------------------------------------------------// db
------------------------------------------------------------------------------// d8
const double EPS = 1e-9;------------------------------------------------------// 18
const double pi = acos(-1);---------------------------------------------------// ec
typedef unsigned long long ull;-----------------------------------------------// 30
typedef vector<vi> vvi;-------------------------------------------------------// 92
typedef vector<vii> vvii;-----------------------------------------------------// fc
template <class T> T mod(T a, T b) { return (a % b + b) % b; }----------------// 3f
```

1.3. Java Template.

A Java template.

```
import java.util.*;-----------------------------------------------------------// 37
import java.math.*;-----------------------------------------------------------// 89
import java.io.*;-------------------------------------------------------------// 28
------------------------------------------------------------------------------// a3
public class Main {-----------------------------------------------------------// 17
----public static void main(String[] args) throws Exception {-----------------// 02
--------Scanner in = new Scanner(System.in);----------------------------------// ef
--------PrintWriter out = new PrintWriter(System.out, false);-----------------// 62
--------// code---------------------------------------------------------------// e6
--------out.flush();----------------------------------------------------------// 56
----}-------------------------------------------------------------------------// 79
}-----------------------------------------------------------------------------// 00
```

2. Data Structures

2.1. Union-Find.

```
struct union_find {-----------------------------------------------------------// 42
----vi p; union_find(int n) : p(n, -1) { }------------------------------------// 28
----int find(int x) { return p[x] < 0 ? x : p[x] = find(p[x]); }--------------// ba
----bool unite(int x, int y) {------------------------------------------------// 6c
--------int xp = find(x), yp = find(y);---------------------------------------// 64
--------if (xp == yp) return false;-------------------------------------------// 0b
--------if (p[xp] > p[yp]) swap(xp,yp);---------------------------------------// 78
--------p[xp] += p[yp], p[yp] = xp;-------------------------------------------// 88
--------return true; }--------------------------------------------------------// 1f
----int size(int x) { return -p[find(x)]; } };--------------------------------// b9
```

2.2. Segment Tree.

```
#ifdef SEG_MIN----------------------------------------------------------------// 03
const int ID = INF;-----------------------------------------------------------// 56
int f(int a, int b) { return min(a, b); }-------------------------------------// 4f
#else-------------------------------------------------------------------------// 0e
const int ID = 0;-------------------------------------------------------------// 3e
int f(int a, int b) { return a + b; }-----------------------------------------// dd
#endif------------------------------------------------------------------------// 16
struct segment_tree {---------------------------------------------------------// ab
----int n; vi data, lazy;-----------------------------------------------------// dd
----segment_tree() {}---------------------------------------------------------// 93
----segment_tree(const vi &arr) : n(size(arr)), data(4*n), lazy(4*n,INF) {----// f1
--------mk(arr, 0, n-1, 0); }-------------------------------------------------// e9

}------------------------------------------------------------------------------// d8
```

5.2. **Binomial Coefficients.** The binomial coefficient $\binom{n}{k} = \frac{n!}{k!(n-k)!}$ is the number of ways to choose k items out of a total of n items. Also contains an implementation of Lucas' theorem for computing the answer modulo a prime p.

```
int nck(int n, int k) {--------------------------------------------------------// f6
----if (n < k) return 0;-------------------------------------------------------// 55
----k = min(k, n - k);---------------------------------------------------------// bd
----int res = 1;---------------------------------------------------------------// e6
----rep(i,1,k+1) res = res * (n - (k - i)) / i;--------------------------------// 4d
----return res;----------------------------------------------------------------// 1f
}------------------------------------------------------------------------------// 6c
int nck(int n, int k, int p) {-------------------------------------------------// cf
----int res = 1;---------------------------------------------------------------// 5c
----while (n || k) {-----------------------------------------------------------// e2
--------res *= nck(n % p, k % p);----------------------------------------------// cc
--------res %= p, n /= p, k /= p;----------------------------------------------// 0a
----}--------------------------------------------------------------------------// d9
----return res;----------------------------------------------------------------// 30
}------------------------------------------------------------------------------// 0a
```

5.3. **Euclidean algorithm.**

```
int gcd(int a, int b) { return b == 0 ? a : gcd(b, a % b); }-------------------// d9
```

The extended Euclidean algorithm computes the greatest common divisor d of two integers a, b and also finds two integers x, y such that $a \times x + b \times y = d$.

```
int egcd(int a, int b, int& x, int& y) {---------------------------------------// 85
----if (b == 0) { x = 1; y = 0; return a; }------------------------------------// 7b
----else {---------------------------------------------------------------------// 00
--------int d = egcd(b, a % b, x, y);------------------------------------------// 34
--------x -= a / b * y;--------------------------------------------------------// 4a
--------swap(x, y);------------------------------------------------------------// 26
--------return d;--------------------------------------------------------------// db
----}--------------------------------------------------------------------------// 9e
}------------------------------------------------------------------------------// 40
```

5.4. **Trial Division Primality Testing.**

```
bool is_prime(int n) {---------------------------------------------------------// 6c
----if (n < 2) return false;---------------------------------------------------// c9
----if (n < 4) return true;----------------------------------------------------// d9
----if (n % 2 == 0 || n % 3 == 0) return false;--------------------------------// 0f
----if (n < 25) return true;---------------------------------------------------// ef
----int s = static_cast<int>(sqrt(static_cast<double>(n)));--------------------// 64
----for (int i = 5; i <= s; i += 6)--------------------------------------------// 6c
--------if (n % i == 0 || n % (i + 2) == 0) return false;----------------------// e9
----return true; }-------------------------------------------------------------// 43
```

5.5. **Miller-Rabin Primality Test.**

```
#include "mod_pow.cpp"---------------------------------------------------------// c7
bool is_probable_prime(ll n, int k) {------------------------------------------// be
----if (~n & 1) return n == 2;-------------------------------------------------// d1
----if (n <= 3) return n == 3;-------------------------------------------------// 39
----int s = 0; ll d = n - 1;---------------------------------------------------// 37
----while (~d & 1) d >>= 1, s++;-----------------------------------------------// 35
----while (k--) {--------------------------------------------------------------// c8
--------ll a = (n - 3) * rand() / RAND_MAX + 2;--------------------------------// 06
--------ll x = mod_pow(a, d, n);-----------------------------------------------// 64
--------if (x == 1 || x == n - 1) continue;------------------------------------// 9b
--------bool ok = false;-------------------------------------------------------// 03
--------rep(i,0,s-1) {---------------------------------------------------------// 13
------------x = (x * x) % n;---------------------------------------------------// 90
------------if (x == 1) return false;------------------------------------------// 5c
------------if (x == n - 1) { ok = true; break; }------------------------------// a1
--------}----------------------------------------------------------------------// 3a
--------if (!ok) return false;-------------------------------------------------// 37
----} return true; }-----------------------------------------------------------// fe
```

5.6. **Sieve of Eratosthenes.**

```
vi prime_sieve(int n) {--------------------------------------------------------// 40
----int mx = (n - 3) >> 1, sq, v, i = -1;--------------------------------------// 27
----vi primes;-----------------------------------------------------------------// 8f
----bool* prime = new bool[mx + 1];--------------------------------------------// ef
----memset(prime, 1, mx + 1);--------------------------------------------------// 28
----if (n >= 2) primes.push_back(2);-------------------------------------------// f4
----while (++i <= mx) if (prime[i]) {------------------------------------------// 73
--------primes.push_back(v = (i << 1) + 3);------------------------------------// be
--------if ((sq = i * ((i << 1) + 6) + 3) > mx) break;-------------------------// 2d
--------for (int j = sq; j <= mx; j += v) prime[j] = false; }------------------// 2e
----while (++i <= mx) if (prime[i]) primes.push_back((i << 1) + 3);------------// 29
----delete[] prime; // can be used for O(1) lookup-----------------------------// 36
----return primes; }-----------------------------------------------------------// 72
```

5.7. **Modular Multiplicative Inverse.**

```
#include "egcd.cpp"------------------------------------------------------------// 55
-------------------------------------------------------------------------------// e8
int mod_inv(int a, int m) {----------------------------------------------------// 49
----int x, y, d = egcd(a, m, x, y);--------------------------------------------// 3e
----if (d != 1) return -1;-----------------------------------------------------// 20
----return x < 0 ? x + m : x;--------------------------------------------------// 3c
}------------------------------------------------------------------------------// 69
```

5.8. Chinese Remainder Theorem.

```
#include "egcd.cpp"----------------------------------------------------// 55
int crt(const vi& as, const vi& ns) {---------------------------------// c3
----int cnt = size(as), N = 1, x = 0, r, s, l;------------------------// 55
----rep(i,0,cnt) N *= ns[i];------------------------------------------// b1
----rep(i,0,cnt) egcd(ns[i], l = N/ns[i], r, s), x += as[i] * s * l;--// 21
----return mod(x, N); }-----------------------------------------------// b2
```

5.9. Linear Congruence Solver.

A function that returns all solutions to $ax \equiv b \pmod{n}$, modulo n.

```
#include "egcd.cpp"----------------------------------------------------// 55
vi linear_congruence(int a, int b, int n) {---------------------------// c8
----int x, y, d = egcd(a, n, x, y);-----------------------------------// 7a
----vi res;-----------------------------------------------------------// f5
----if (b % d != 0) return res;---------------------------------------// 30
----int x0 = mod(b / d * x, n);---------------------------------------// 48
----rep(k,0,d) res.push_back(mod(x0 + k * n / d, n));-----------------// 7e
----return res;-------------------------------------------------------// fe
}---------------------------------------------------------------------// c0
```

5.10. Numeric Integration.

```
double integrate(double (*f)(double), double a, double b,-------------// 76
--------double delta = 1e-6) {----------------------------------------// c0
----if (abs(a - b) < delta)-------------------------------------------// 38
--------return (b-a)/8 *----------------------------------------------// 56
------------(f(a) + 3*f((2*a+b)/3) + 3*f((a+2*b)/3) + f(b));----------// e1
----return integrate(f, a,--------------------------------------------// 64
------------(a+b)/2, delta) + integrate(f, (a+b)/2, b, delta);--------// 0c
}---------------------------------------------------------------------// 4b
```

5.11. Fast Fourier Transform.

The Cooley-Tukey algorithm for quickly computing the discrete Fourier transform. The `fft` function only supports powers of twos. The `czt` function implements the Chirp Z-transform and supports any size, but is slightly slower.

```
#include <complex>----------------------------------------------------// 8e
typedef complex<long double> cpx;-------------------------------------// 25
// NOTE: n must be a power of two-------------------------------------// 14
void fft(cpx *x, int n, bool inv=false) {-----------------------------// 36
----for (int i = 0, j = 0; i < n; i++) {------------------------------// f9
--------if (i < j) swap(x[i], x[j]);----------------------------------// 44
--------int m = n>>1;-------------------------------------------------// 9c
--------while (1 <= m && m <= j) j -= m, m >>= 1;---------------------// fe
--------j += m;-------------------------------------------------------// 11
----}-----------------------------------------------------------------// d0
----for (int mx = 1; mx < n; mx <<= 1) {------------------------------// 15
--------cpx wp = exp(cpx(0, (inv ? -1 : 1) * pi / mx)), w = 1;--------// 79
--------for (int m = 0; m < mx; m++, w *= wp) {-----------------------// dc
------------for (int i = m; i < n; i += mx << 1) {--------------------// 6a
----------------cpx t = x[i + mx] * w;--------------------------------// 12
----------------x[i + mx] = x[i] - t;---------------------------------// 73
----------------x[i] += t;--------------------------------------------// 0e
------------}---------------------------------------------------------// 14
--------}-------------------------------------------------------------// a4
----}-----------------------------------------------------------------// bf
----if (inv) rep(i,0,n) x[i] /= cpx(n);-------------------------------// 16
}---------------------------------------------------------------------// 1c
void czt(cpx *x, int n, bool inv=false) {-----------------------------// c5
----int len = 2*n+1;--------------------------------------------------// bc
----while (len & (len - 1)) len &= len - 1;---------------------------// 65
----len <<= 1;--------------------------------------------------------// 21
----cpx w = exp(-2.0L * pi / n * cpx(0,1)),---------------------------// 45
--------*c = new cpx[n], *a = new cpx[len],---------------------------// 4e
--------*b = new cpx[len];--------------------------------------------// 30
----rep(i,0,n) c[i] = pow(w, (inv ? -1.0 : 1.0)*i*i/2);---------------// 9e
----rep(i,0,n) a[i] = x[i] * c[i], b[i] = 1.0L/c[i];------------------// e9
----rep(i,0,n-1) b[len - n + i + 1] = 1.0L/c[n-i-1];------------------// 9f
----fft(a, len); fft(b, len);-----------------------------------------// 63
----rep(i,0,len) a[i] *= b[i];----------------------------------------// 58
----fft(a, len, true);------------------------------------------------// 2d
----rep(i,0,n) {------------------------------------------------------// ff
--------x[i] = c[i] * a[i];-------------------------------------------// 77
--------if (inv) x[i] /= cpx(n);--------------------------------------// b1
----}-----------------------------------------------------------------// 27
----delete[] a;-------------------------------------------------------// 0a
----delete[] b;-------------------------------------------------------// 5c
----delete[] c;-------------------------------------------------------// f8
}---------------------------------------------------------------------// c6
```

5.12. Formulas.

- Number of permutations of n objects, where there are n_1 objects of type 1, n_2 objects of type 2, $\ldots$, n_k objects of type k: $\binom{n}{n_1,n_2,\ldots,n_k} = \frac{n!}{n_1! \times n_2! \times \cdots \times n_k!}$
- Number of ways to choose k objects from a total of n objects where order does not matter and each item can be chosen multiple times: $f_k^n = \binom{n+k-1}{k} = \frac{(n+k-1)!}{k!(n-1)!}$
- Number of integer solutions to $x_1 + x_2 + \cdots + x_n = k$ where $x_i \geq 0$: f_k^n
- Number of strings with n sets of brackets such that the brackets are balanced: $C_n = \sum_{k=0}^{n-1} C_k C_{n-1-k} = \frac{1}{n+1}\binom{2n}{n}$
- Number of triangulations of a convex polygon with n points, number of rooted binary trees with $n+1$ vertices, number of paths across an $n \times n$ lattice which do not rise above the main diagonal: C_n
- Number of permutations of n objects with exactly k ascending sequences or *runs*: $\left\langle {n \atop k} \right\rangle = \left\langle {n \atop n-k-1} \right\rangle = k\left\langle {n-1 \atop k} \right\rangle + (n-k+1)\left\langle {n-1 \atop k-1} \right\rangle = \sum_{i=0}^{k}(-1)^i\binom{n+1}{i}(k+1-i)^n, \left\langle {n \atop 0} \right\rangle = \left\langle {n \atop n-1} \right\rangle = 1$
- Number of permutations of n objects with exactly k cycles: $\left[{n \atop k}\right] = \left[{n-1 \atop k-1}\right] + (n-1)\left[{n-1 \atop k}\right]$
- Number of ways to partition n objects into k sets: $\left\{{n \atop k}\right\} = k\left\{{n-1 \atop k}\right\} + \left\{{n-1 \atop k-1}\right\}, \left\{{n \atop 0}\right\} = \left\{{n \atop n}\right\} = 1$
- Number of permutations of length n that have no fixed points (derangements): $D_0 = 1, D_1 = 0, D_n = (n-1)(D_{n-1} + D_{n-2})$
- Number of permutations of length n that have exactly k fixed points: $\binom{n}{k}D_{n-k}$
- **Jacobi symbol:** $\left(\frac{a}{b}\right) = a^{(b-1)/2} \pmod{b}$
- **Heron's formula:** A triangle with side lengths a, b, c has area $\sqrt{s(s-a)(s-b)(s-c)}$ where $s = \frac{a+b+c}{2}$.
- **Pick's theorem:** A polygon on an integer grid containing i lattice points and having b lattice points on the boundary has area $i + \frac{b}{2} - 1$.

- **Divisor sigma:** The sum of divisors of n to the xth power is $\sigma_x(n) = \prod_{i=0}^{r} \frac{p_i^{(a_i+1)x}-1}{p_i^x-1}$ where $n = \prod_{i=0}^{r} p_i^{a_i}$ is the prime factorization.
- **Euler's totient:** The number of integers less than n that are comprime to n are $n\prod_{p|n}\left(1-\frac{1}{p}\right)$ where each p is a distinct prime factor of n.
- $\gcd(2^a-1, 2^b-1) = 2^{\gcd(a,b)}-1$
- **Wilson's theorem:** $(n-1)! \equiv -1 \pmod{n}$ iff. n is prime
- **Lagrange polynomial** through points $(x_0,y_0),\ldots,(x_k,y_k)$ is $L(x) = \sum_{j=0}^{k} y_j \prod_{\substack{0\le m\le k\\ m\ne j}} \frac{x-x_m}{x_j-x_m}$

5.13. **Numbers and Sequences.** Some random prime numbers: 1031, 32771, 1048583, 33554467, 1073741827, 34359738421, 1099511627791, 35184372088891, 1125899906842679, 36028797018963971.

6. Geometry

6.1. Primitives.

```

```

6.10. Formulas.

Let $a = (a_x, a_y)$ and $b = (b_x, b_y)$ be two-dimensional vectors.

- $a \cdot b = |a||b| \cos\theta$, where θ is the angle between a and b.
- $a \times b = |a||b| \sin\theta$, where θ is the signed angle between a and b.
- $a \times b$ is equal to the area of the parallelogram with two of its sides formed by a and b. Half of that is the area of the triangle formed by a and b.

7. Other Algorithms

--------3 * ((y + 4900 + (m - 14) / 12) / 100) / 4 +----------------------------// be
--------d - 32075;--------------------------------------------------------------// e0
}-------------------------------------------------------------------------------// fa
void intToDate(int jd, int &y, int &m, int &d) {--------------------------------// a1
----int x, n, i, j;-------------------------------------------------------------// 00
----x = jd + 68569;-------------------------------------------------------------// 11
----n = 4 * x / 146097;---------------------------------------------------------// 2f
```

```
----x -= (146097 * n + 3) / 4;----------------------------------------------------// 58
----i = (4000 * (x + 1)) / 1461001;-----------------------------------------------// 0d
----x -= 1461 * i / 4 - 31;-------------------------------------------------------// 09
----j = 80 * x / 2447;------------------------------------------------------------// 3d
----d = x - 2447 * j / 80;--------------------------------------------------------// eb
----x = j / 11;-------------------------------------------------------------------// b7
----m = j + 2 - 12 * x;-----------------------------------------------------------// 82
----y = 100 * (n - 49) + i + x;---------------------------------------------------// 70
}---------------------------------------------------------------------------------// af
```

8. Useful Information

8.1. Tips & Tricks.

- How fast does our algorithm have to be? Can we use brute-force?
- Does order matter?
- Is it better to look at the problem in another way? Maybe backwards?
- Are there subproblems that are recomputed? Can we cache them?
- Do we need to remember everything we compute, or just the last few iterations of computation?
- Does it help to sort the data?
- Can we speed up lookup by using a map (tree or hash) or an array?
- Can we binary search the answer?
- Can we add vertices/edges to the graph to make the problem easier? Can we turn the graph into some other kind of a graph (perhaps a DAG, or a flow network)?
- Make sure integers are not overflowing.
- Is it better to compute the answer modulo n? Perhaps we can compute the answer modulo $m_1, m_2, \ldots, m_k$, where $m_1, m_2, \ldots, m_k$ are pairwise coprime integers, and find the real answer using CRT?
- Are there any edge cases? When $n = 0, n = -1, n = 1, n = 2^{31} - 1$ or $n = -2^{31}$? When the list is empty, or contains a single element? When the graph is empty, or contains a single vertex? When the graph contains self-loops? When the polygon is concave or non-simple?
- Can we use exponentiation by squaring?

8.2. Fast Input Reading.

```
void readn(register int *n) {-----------------------------------------------------// dc
----int sign = 1;-----------------------------------------------------------------// 32
----register char c;--------------------------------------------------------------// a5
----*n = 0;-----------------------------------------------------------------------// 35
----while((c = getc_unlocked(stdin)) != '\n') {-----------------------------------// f3
--------switch(c) {---------------------------------------------------------------// 0c
------------case '-': sign = -1; break;-------------------------------------------// 28
------------case ' ': goto hell;--------------------------------------------------// fd
------------case '\n': goto hell;-------------------------------------------------// 79
------------default: *n *= 10; *n += c - '0'; break;------------------------------// c0
--------}-------------------------------------------------------------------------// 2d
----}-----------------------------------------------------------------------------// c3
hell:-----------------------------------------------------------------------------// ba
----*n *= sign;-------------------------------------------------------------------// a0
}---------------------------------------------------------------------------------// 67
```

8.3. Bit Hacks.

- `n & -n` returns the first set bit in n.
- `n & (n - 1)` is 0 only if n is a power of two.
- `snoob(x)` returns the next integer that has the same amount of bits set as `x`. Useful for iterating through subsets of some specified size.

```
int snoob(int x) {-----------------------------------------------------------------
----int y = x & -x, z = x + y;-----------------------------------------------------
----return z | ((x ^ z) >> 2) / y;-------------------------------------------------
}----------------------------------------------------------------------------------
```
