5.9. Modular Exponentiation. A function to perform fast modular exponentiation.
                                          ----for (int mx = 1; mx < n; mx <<= 1) {------// 9d
----while (e) {------------------------// b7 ------cpx t = x[i + mx] * w;------// f5
```

5.14. Formulas.

- Number of ways to choose k objects from a total of n objects where order matters and each item can only be chosen once: $P_k^n = \frac{n!}{(n-k)!}$
- Number of ways to choose k objects from a total of n objects where order matters and each item can be chosen multiple times: n^k
- Number of permutations of n objects, where there are n_1 objects of type 1, n_2 objects of type 2, ..., n_k objects of type k: $\binom{n}{n_1, n_2, ..., n_k} = \frac{n!}{n_1! \times n_2! \times \cdots \times n_k!}$
- Number of ways to choose k objects from a total of n objects where order does not matter and each item can only be chosen once:

$$\binom{n}{k} = \binom{n-1}{k-1} + \binom{n-1}{k} = \binom{n}{n-k} = \prod_{i=1}^k \frac{n-(k-i)}{i} = \frac{n!}{k!(n-k)!}, \binom{n}{0} = 1, \binom{0}{k} = 0$$

- Number of ways to choose k objects from a total of n objects where order does not matter and each item can be chosen multiple times: $f_k^n = \binom{n+k-1}{k} = \frac{(n+k-1)!}{k!(n-1)!}$
- Number of integer solutions to $x_1 + x_2 + \cdots + x_n = k$ where $x_i \geq 0$: f_k^n
- Number of subsets of a set with n elements: 2^n
- $|A \cup B| = |A| + |B| |A \cap B|$
- $|A \cup B \cup C| = |A| + |B| + |C| |A \cap B| |A \cap C| |B \cap C| + |A \cap B \cap C|$
- Number of ways to walk from the lower-left corner to the upper-right corner of an $n \times m$ grid by walking only up and to the right: $\binom{n+m}{m}$
- Number of strings with n sets of brackets such that the brackets are balanced: $\sum_{n=1}^{n-1} c_n c_n = \frac{1}{2n}$
- $C_n = \sum_{k=0}^{n-1} C_k C_{n-1-k} = \frac{1}{n+1} {2n \choose n}$
- Number of triangulations of a convex polygon with n points, number of rooted binary trees with n+1 vertices, number of paths across an $n \times n$ lattice which do not rise above the main diagonal: C_n
- Number of permutations of n objects with exactly k ascending sequences or runs:

- Number of permutations of n objects with exactly k cycles: $\binom{n}{k} = \binom{n-1}{k-1} + (n-1) \binom{n-1}{k}$
- Number of ways to partition n objects into k sets: $\begin{Bmatrix} n \\ k \end{Bmatrix} = k \begin{Bmatrix} n-1 \\ k \end{Bmatrix} + \begin{Bmatrix} n-1 \\ k-1 \end{Bmatrix}, \begin{Bmatrix} n \\ 0 \end{Bmatrix} = \begin{Bmatrix} n \\ n \end{Bmatrix} = 1$
- Number of permutations of length n that have no fixed points (derangements): $D_0 = 1, D_1 = 0, D_n = (n-1)(D_{n-1} + D_{n-2})$
- Number of permutations of length n that have exactly k fixed points: $\binom{n}{k}D_{n-k}$
- Jacobi symbol: $\left(\frac{a}{b}\right) = a^{(b-1)/2} \pmod{b}$
- Heron's formula: A triangle with side lengths a, b, c has area $\sqrt{s(s-a)(s-b)(s-c)}$ where $s = \frac{a+b+c}{2}$.
- Pick's theorem: A polygon on an integer grid containing i lattice points and having b lattice points on the boundary has area $i + \frac{b}{2} 1$.
- Divisor sigma: The sum of divisors of n to the xth power is $\sigma_x(n) = \prod_{i=0}^r \frac{p_i^{(a_i+1)x}-1}{p_i^{x}-1}$ where $n = \prod_{i=0}^r p_i^{a_i}$ is the prime factorization.
- Divisor count: A special case of the above is $\sigma_0(n) = \prod_{i=0}^r (a_i + 1)$.
- Euler's totient: The number of integers less than n that are comprime to n are $n \prod_{p|n} \left(1 \frac{1}{p}\right)$ where each p is a distinct prime factor of n.
- König's theorem: In any bipartite graph, the number of edges in a maximum matching is equal to the number of vertices in a minimum vertex cover.

- The number of vertices of a graph is equal to its minimum vertex cover number plus the size of a maximum independent set.
- $gcd(2^a 1, 2^b 1) = 2^{gcd(a,b)} 1$

5.15. **Numbers and Sequences.** Some random prime numbers: 1031, 32771, 1048583, 33554467, 1073741827, 34359738421, 1099511627791, 35184372088891, 1125899906842679, 36028797018963971.

6. Geometry

6.1. **Primitives.** Geometry primitives.

```

- 6.8. Formulas. Let $a = (a_x, a_y)$ and $b = (b_x, b_y)$ be two-dimensional vectors.
 - $a \cdot b = |a||b|\cos\theta$, where θ is the angle between a and b.
 - $a \times b = |a||b|\sin\theta$, where θ is the signed angle between a and b.
 - $a \times b$ is equal to the area of the parallelogram with two of its sides formed by a and b. Half of that is the area of the triangle formed by a and b.

7. Other Algorithms

7.1. Binary Search. An implementation of binary search that finds a real valued root of the continous function f on the interval [a, b], with a maximum error of ε .

Another implementation that takes a binary predicate f, and finds an integer value x on the integer interval [a,b] such that $f(x) \wedge \neg f(x-1)$.

7.2. **Ternary Search.** Given a function f that is first monotonically increasing and then monotonically decreasing, ternary search finds the x such that f(x) is maximized.

7.3. **2SAT.** A fast 2SAT solver.

----return per;-----// 84
                                                     • Are there any edge cases? When n = 0, n = -1, n = 1, n = 2^{31} - 1 or n = -2^{31}? When
}-----// 97
                                                      the list is empty, or contains a single element? When the graph is empty, or contains a single
7.7. Cycle-Finding. An implementation of Floyd's Cycle-Finding algorithm.
                                                      vertex? When the graph contains self-loops? When the polygon is concave or non-simple?
ii find_cycle(int x0, int (*f)(int)) {------// a5
                                                     • Can we use exponentiation by squaring?
----int t = f(x0), h = f(t), mu = 0, lam = 1;-----// 8d
                                                  8.2. Fast Input Reading. If input or output is huge, sometimes it is beneficial to optimize the input
----while (t != h) t = f(t), h = f(f(h));-----// 79
                                                  reading/output writing. This can be achieved by reading all input in at once (using fread), and then
----h = x0:-----// 04
                                                  parsing it manually. Output can also be stored in an output buffer and then dumped once in the end
----while (t != h) t = f(t), h = f(h), mu++;-----// 9d
                                                  (using fwrite). A simpler, but still effective, way to achieve speed is to use the following input reading
----h = f(t):-----// 00
----while (t != h) h = f(h), lam++;-----// 5e
----return ii(mu, lam);-----// b4
                                                  void readn(register int *n) {------// dc
                                                  ----int sign = 1;------// 32
}------// 42
                                                  ----register char c:-----// a5
7.8. Dates. Functions to simplify date calculations.
```

Reykjavík University

8.3. **128-bit Integer.** GCC has a 128-bit integer data type named __int128. Useful if doing multiplication of 64-bit integers, or something needing a little more than 64-bits to represent.

8.4. Worst Time Complexity.

n	Worst AC Algorithm	Comment		
≤ 10	$O(n!), O(n^6)$	e.g. Enumerating a permutation		
≤ 15	$O(2^n \times n^2)$ e.g. DP TSP			
≤ 20	$O(2^n), O(n^5)$	e.g. $DP + bitmask technique$		
≤ 50	$O(n^4)$	e.g. DP with 3 dimensions $+ O(n)$ loop, choosing ${}_{n}C_{k} = 4$		
$\leq 10^{2}$	$O(n^3)$	e.g. Floyd Warshall's		
$\leq 10^{3}$	$O(n^2)$	$O(n^2)$ e.g. Bubble/Selection/Insertion sort		
$\le 10^{5}$	$O(n \log_2 n)$	e.g. Merge sort, building a Segment tree		
$\le 10^{6}$	$O(n), O(\log_2 n), O(1)$	Usually, contest problems have $n \leq 10^6$ (e.g. to read input)		

8.5. Bit Hacks.

- n & -n returns the first set bit in n.
- n & (n 1) is 0 only if n is a power of two.
- snoob(x) returns the next integer that has the same amount of bits set as x. Useful for iterating through subsets of some specified size.
